variability can influence patterns of rainfall, temperature and other variables on timescales anywhere from a few weeks to a few decades. While the long-term trends of climate change are considered by scientists to be largely human-caused, climate variability is mostly due to natural oscillations in the earth's systems (though there are

Analysis of climate variability and trends frequently takes place at large scale. For agricultural applications, however, highly localized climate conditions can be critically important. This certainly applies to tropical highland regions, where dissected topography and convectively dominated precipitation processes

Natural modes of variability in the earth's climate system are often overlapped in space and thus not to be readily separated by EOF analysis, whose modes are orthogonal by construction.

Presumably the transform matrix of REOF allows rotated modes to overlap, which would make them a better representation of the
