An airlift pump is a pump that has low suction and moderate discharge of liquid and entrained solids. The pump injects compressed air at the bottom of the discharge pipe which is immersed in the liquid. The compressed air mixes with the liquid causing the air-water mixture to be less dense than the rest of

Carbon dioxide driven airlift pumps were considered for use in the BP oil spill that occurred on April 20, 2010 in the Gulf of Mexico (Knisely, 2010). The drawback to using an airlift pump is that airlift pumps operate at significantly lower efficiencies than mechanical pumps.
