Stiffness Matrices, Spring and Bar Elements

$y_d A = 0$ (4.8) which is satisfied if the xz plane ($y = 0$) passes through the centroid of the area. Thus, we obtain the well-known result that the neutral surface is perpendicular to the plane of bending and passes through the centroid of the cross-sectional area. Hutton: Fundamentals of Finite Element Analysis 4.

Flexure Elements

The primary characteristics of a finite element are embodied in the element stiffness matrix. For a structural finite element, the stiffness matrix contains the geometric and material behavior information that indicates the resistance of the element to deformation when subjected to loading.
