Linux has a monolithic kernel. For this reason, writing a device driver for Linux requires performing
a combined compilation with the kernel. Another way around is to implement your driver as a
kernel module, in which case you won't need to recompile the kernel to add another driver. We'll be
concerned with this second option: kernel modules.

For drivers that have no bus-specific fields (i.e. don't have a bus-specific driver structure), they
would use driver_register and pass a pointer to their struct device_driver object. Most drivers,
however, will have a bus-specific structure and will need to register with the bus using something
like pci_driver_register.
