Abstract. Morphine alkaloids and some of its derivatives (morphine, codeine, thebaine, oripavine, hydrocodone, and oxycodone) were subjected to fermentations with six fungal strains. The alkaloids were transformed to a variety of products via biological oxidations, reductions, and oxidative demethylations. The strain *Cunninghamella echinulata* proved to be the most effective for demethylations ...

Alkaloids are generated by various living organisms, especially by higher plants - about 10 to 25% of those contain alkaloids. Therefore, in the past the term "alkaloid" was associated with plants. The alkaloids content in plants is usually within a few percent and is inhomogeneous over the plant tissues.

Opium poppy contains at least 50 different alkaloids, but most of them are of very low concentration. Morphine is the principal alkaloid in raw opium and constitutes roughly 8-19% of opium by dry weight (depending on growing conditions). Some purpose-developed strains of poppy now produce opium that is up to 26% morphine by weight.

Cancer therapy has shown terrific progress leading to important reduction of morbidity and mortality of several kinds of cancer. The therapeutic management of oncologic patients includes combinations of drugs, radiation therapy and surgery. Many of these therapies produce adverse cardiovascular complications which may negatively affect both the quality of life and the prognosis.
