where: r D the maximum amplitude the angular frequency $= 2 / T$ T the period of the oscillation the phase angle. For the spring-mass system above, we used the symbol y in the animation in place of r .For the Torsion Pendulum, we used in place of r .The point is that except for the symbols used, the mathematical description of these two systems are identical.

Modulus of Rigidity is the coefficient of elasticity of wire for a shearing force. In simple words, rigidity modulus of a metal wire is a measurement of the capability of a material to resist deformation when external tangential (parallel to the surface) force is applied to the metal wire. Aim of the Test To determine the rigidity modulus [...]

Torsion Pendulum Test on Metal Wire - The Constructor
For a torsional pendulum the wire from which the object is suspended exerts a torque $\tau = -k\theta$ where k is the torsional constant and θ is the angle of twist. This expression holds for large angles of twist and so in the derivation of the period of the torsional pendulum no small angle approximation has to be applied.
